AUTHOR: Kujundžić, Branislav, Engineer, Scientific Assistant
(Beograd)

TITLE: The Diversion Tunnel of the Souk Wadi Barada Hydropower Plant (Dovodni tunel hidroenergetskog postrojenja Souk Wadi Barada)

PERIODICAL: Tehnika, 1959, Nr 3, pp 385-389 (YUG)

ABSTRACT: The author describes the construction of a 2,421-m diversion tunnel, 2 m diameter, at the Souk Wadi Barada Hydropower Plant in Syria, carried out by the "Elektrosrbija" Enterprise, Beograd, and consolidated by grouting by the "Elektrosond" Enterprise, Zagreb. The intake works, aquaduct, surge-tank, and penstock anchor-blocks for this power plant were also constructed by "Elektrosrbija". Test-fillings revealed losses of water in the conduit, caused by leakage, but before additional grouting could be carried out, splits in the

Title : Differential Thermal Analysis of Some Barrandian Lime and
Dolomite Rocks.

Orig Pub : Casop. Narodn. musea. Odd. prirodoved. 1956, 125, No 1,
32-32 (Czech).

Abstract : 19 samples of lime and dolomite rocks of different sites were
studied by method of differential thermal analysis. The re-
sults of chemical analysis for 9 samples are given, which sup-
plement data supplied by the thermal analysis. The composi-
tion of Barrandian lime rocks is characterized by the presence
of dolomite (endothermic effect at 700-900°), of organic com-
pounds (exothermic effect at 200-400°), of quartz (endothermic
effect at 575°) and of adsorbed water (endothermic effect at
100°).

TITLE: The effect of heat treatment on the corrosion resistance of "VTZ-1" type Ti alloy

SOURCE: IVUZ. Chernaya metallurgiya, no. 5, 1964, 135-139

TOPIC TAGS: heat treatment, corrosion resistance, Ti alloy, mechanical property, hardening

ABSTRACT: The authors studied the effects of heat treatment on the mechanical properties of type $\alpha+\beta$ -Ti-alloy and its corrosion resistance. The specimens were widely used "VTZ-1" Ti-alloy specimens which contained 6% Al, 3% Mo and 3% Cr. They were prepared by 800C annealing of 16 mm diam. rods. The heat treatment temperatures were 850, 950, 1050 and 1100C, with a holding period of 30 minutes followed by normalizing and water quenching. Cylinders with a 12-15 mm diam. and a height of 20-22 mm were cut out. A 25% solution of sulfuric acid was used for corrosion tests at 20-24C and 12-15C. The specimens remained in the medium from 260 to 1000 hrs. Ultimate

strength and hardness increased with tempering temperatures up to 500C while plasticity was equal to zero in all tests. The rate of corrosion dropped with raised heat treatment temperatures and at 1100C corrosion attack was negligible. Thermal oxidation enhanced corrosion resistance substantially. Heat treatment affected the structure and strength of the natural passivating oxide film formed by special air heating at temperatures above 600C as well as the strength of the material. Although tempering at 300-400C had negligible effect on the structure after hardening, the rate of corrosion of tempered specimens was lower than that of hardened specimens because of the relief of cooling stresses. In high-hardness alloys (normalizing and quenching from 1050C followed by 500C tempering) the rate of corrosion was rather high. Orig. art. has: 4 figures

TITLE: The effect of thermal processing on the corrosion resistance of the titanium alloy BT3-1 (VTZ-1) in sulphuric acid solutions

PERIODICAL: Zhurnal prikladnoy khimii, v. 34, no. 11, 1961, 2466 - 2472

TEXT: The authors state that the corrosion of thermally processed alloys has not been previously studied. They set out to examine the effect of thermal processing of an $\alpha + \beta$ titanium alloy on corrosion resistance in H_2SO_4 solutions and to detect any link between the alloy's structure and corrosion properties. To this end samples of VTZ-1 titanium (aluminum 6 %, molybdenum 8 %, chromium 3 %) were subjected to various thermal processing regimes. As corroding medium they used 25 % and 75 % H_2SO_4 , in whose concentrations the corrosion rate of titanium is the highest, according to V. V. Andreyeva, and V.N. Kazarin (Ref. 1: DAN SSSR, 121, 5, 1958).

The effect of thermal processing ...

The majority of trials were carried out at 22-24°C with a few at 12-14°C. Three or four specimens were used for a single trial, using 300-400 ml. solution per sample. The samples remained in 25 % H_2SO_4 for 260 hours and in 72 % H_2SO_4 for 48 hours. Corrosion was estimated from external appearance, duration of passivity and loss of weight ($gm/1\ mm^2/hr$ calculated over whole test period with correction for passivity period). Maximum scatter of data for weight loss, under equivalent conditions, was approximately 10 %. The structure of the samples was studied with optical (x500) and electron (x10,000) microscopes. It was found that thermal processing had a marked effect on the corrosion resistance of VTZ-1 titanium alloy in 25 % H_2SO_4 as shown by the change in the period of passivity and corrosion rate of the alloy. This effect was linked with structural differences e.g. the degree of heterogeneity, nature of the dispersion phases and the state of strain of the alloy. The protective properties of the natural oxide film depended mainly on the heterogeneity of the structure, the period of passivity diminishing with coarser structure. Single phase or coarsely heterogene-

TITLE: **Organic Insecti- and Fungicides** (Iz oblasti organicheskikh insektofungitsidov). XXVIII. The Synthesis of Some Ethers of Bicyclo-(2,2,1)-Heptenyl-5-Carbinol-2 (XXVIII). Sintez nekotorykh efirov bitsiklo-(2,2,1)-geptenil-5-karbinola-2).

PERIODICAL: Zhurnal Obshchey Khimii, 1958, Vol. 28, Nr 1, pp. 154-157 (USSR).

ABSTRACT: Much attention was recently paid to different polycyclic compounds obtained by the way of diene-synthesis from cyclopentadiene and hexachlorocyclopentadiene, because extremely active insecticides were found among them (reference 1-6). For this reason syntheses of similar polycyclic compounds were performed, in order to determine the dependence of this activity on their structure. Above all the authors synthesized various ethers of bicyclo-(2,2,1)-heptenyl-5-carbinol-2 by conversion of cyclopentadiene with allyl esters of different acids. These syntheses were of importance, as the condensation of cyclopentadiene was hitherto known in publications only with allyl alcohol, chloro- and bromoallyl, some vinyl ether, acrolein,

of Some Ethers of Bicyclo-(2,2,1)-Heptenyl-5-Carbinol-2.

acetylene and a few other compounds. The reaction of cyclopentadiene with the allyl esters of various acids takes place at an elevated temperature in an autoclave or in sealed tubes at some pressure. The conversion can be represented according to the given scheme. The synthesized compounds and their properties are described in the table. As in the published syntheses of cyclopentadiene with allyl alcohol, bromo- and chloro-allyl only the boiling points were given, the authors also described the syntheses of these compounds, as well as the synthesis of 2,3-dichlorobicyclo-(2,2,1)-heptene-5 from trans-dichloroethylene and cyclopentadiene. For the purpose of a synthesis of the different arylbicyclo-(2,2,1)-heptadienes the conversion of cyclopentadiene with phenylchlorophenyl-, bromophenyl- and tolylacetalynes was investigated, but it was not possible to isolate the monomeric reaction products. Only solid polymers with high molecular weights were obtained on that occasion. There are 1 table and 13 references, 10 of which are Slavic.

TITLE: **Organic Insecti- and Fungicides** (Iz oblasti organicheskikh insektofungitsidov). XXIX. On the Interaction of Hexachlorocyclopentadiene With Some Unsaturated Compounds (XXIX. O vzaimodeystvii geksakhlortsiklopentadiyena s nekotorymi nepredel'nymi soyedineniyami).

PERIODICAL: Zhurnal Obshchey Khimii, 1958, Vol. 28, Nr 1, pp. 157-161 (USSR).

ABSTRACT: In order to find new active insecticides, the authors investigated the reaction products of hexachlorocyclopentadiene with various unsaturated compounds, first of all some ethers of allyl alcohol and bicyclo-(2,2,1)-heptenyl-5-carbinol-2. Moreover the reaction of hexachlorocyclopentadiene with ethyl- and isobutylvinyl-ethers was investigated. The conversion of the allyl esters of different fatty acids and the allyl ester of dithiophosphoric acid with hexachlorocyclopentadiene takes place comparatively easily on heating of equimolecular amounts of the initial product at 100-125° C within 10-12 hours, where the corresponding derivatives are obtained with yields of 50-60%. These conversions can be represented by scheme (I).

Card 1/3

Organic Insecti- and Fungicides

XXIX. On the Interaction 79-1-33/63
of Hexachlorocyclopentadiene With Some Unsaturated Compounds.

The synthesized compounds and their properties are given in the table. Some of these compounds are already known from publications, but they were either synthesized according to other methods or their constants were not given. The condensation of hexachlorocyclopentadiene with the ethers of bicyclo-(2,2,1)-heptenyl-5-carbinol-2 takes place considerably slower so that a heating of the reaction mixture at 125-130° C and not less than 15 hours are needed in order to obtain a 50% yield of the derivative. This reaction takes place according to scheme (II). Of all investigated compounds the vinyl ethers react most easily with hexachlorocyclopentadiene and they are bound to the latter already at 80-90° C, but its reaction with the bicyclic compounds even at elevated temperatures takes place considerably slower. As far as the insecticide activity is concerned they have a much smaller effectiveness than this is the case with aldrin and even chlorindane. There are 1 table, and 9 references, 5 of which are Slavic.

TITLE: Study of Polarographic Properties of Gallium and Indium (Izucheniye polyarograficheskikh svoystv galliya i indiya)

PERIODICAL: Tr. In-ta metallurgii. Ural'skiy fil. AN SSSR, 1958, Nr 2, pp 263-274

ABSTRACT: Investigations were carried out for establishing the optimum conditions for polarographic determination of Ga and In. It was established that in acid salicylate solutions (0.1 M Na salicylate and 0.1 M NaCl with a pH of 2.5-3.8) Ga forms a well defined wave with $E_{1/2} = -0.99$ v (in saturated standard electrolyte); introduction of gelatin has a negative effect. The electrode reaction corresponds to a three-electron reduction and proceeds irreversibly. With an increase of the salicylate content in the solution $E_{1/2}$ shifts in the negative sense. The polarographic determination is not impeded by Al, As^{5+} , Mn^{7+} , and small amounts of Cu, Bi, Sb, Fe, In, Cd, Pb, and Tl. Zn, Ni, Co, Mo, and Sn should be first removed. In is read polarographically against the background of 3N HCl in the presence of 0.01% solution
